## Regents Chemistry:

# Practice Packet Unit 8: Gases 

## Vocabulary:

Absolute Zero: $\qquad$
Avogadro's Hypothesis: $\qquad$
(Normal) Boiling Point: $\qquad$
Direct Relationship: $\qquad$
Evaporating: $\qquad$
Gas: $\qquad$
Ideal Gas: $\qquad$
Indirect Relationship: $\qquad$
Kinetic Molecular Theory (KMT): $\qquad$
Pressure: $\qquad$
Temperature: $\qquad$

## LESSON 1: KINETIC MOLECULAR THEORY: IDEAL VS REAL GASES

## Objective:

- Describe the behavior of ideal gases based on the Kinetic Molecular Theory
- Differentiate between ideal and real gases
- Determine when real gases behave most like ideal gases.

KMT is the study of how $\qquad$ gases behave.

Major Understandings of KMT (YOU MUST MEMORIZE!!!)

1. Particles of an ideal gas move in random, constant, $\qquad$ motion.
2. Particles of an ideal gas are separated by great distances relative to their size; the volume of gas particles is considered $\qquad$ .
3. Particles of an ideal gas have $\qquad$ attractive force between them.
4. Particles of an ideal gas have collisions that may result in a transfer of energy between particles, but the total energy of the system $\qquad$ .

Real gases behave most like ideal gases under $\qquad$ pressure and $\qquad$ temperature. To help you remember use the acronym $\qquad$
Identify the conditions that are most ideal, A or B :
1.
A
B

(a) Low pressure

(b) High pressure
2.

A

Cool gas, fewer and less energetic collisions
2. How can you get a real gas to behave the least like an ideal gas?

B

Hot gas, more and more energetic collision
3. Of the following: $\mathrm{H}_{2}, \mathrm{He}, \mathrm{CO}_{2}$, which would behave least like an ideal gas and why?
4. Which of the gases in question 3 behaves the most like ideal gases/ Why?
5. Why do gases behave least like ideal gases at low temperatures and high pressures?

## Regents Questions:

1. Two basic properties of the gas phase are
(1) a definite shape and a definite volume
(3) no definite shape but a definite volume
(2) a definite shape but no definite volume
(4) no definite shape and no definite volume
2. According to the kinetic molecular theory, the molecules of an ideal gas
(1) have a strong attraction for each other
(3) move in random, constant, straight-line motion
(2) have significant volume
(4) are closely packed in a regular repeating pattern
3. According to the kinetic molecular theory, which assumption is correct?
(1) Gas particles strongly attract each other.
(2) Gas particles travel in curved paths.
(3) The volume of gas particles prevents random motion.
(4) Energy may be transferred between colliding particles.
4. Helium is most likely to behave as an ideal gas when it is under
(1) high pressure and high temperature
(3) low pressure and high temperature
(2) high pressure and low temperature
(4) low pressure and low temperature
5. Under which conditions of temperature and pressure does oxygen gas behave least like an ideal gas?
(1) low temperature and low pressure
(3) high temperature and low pressure
(2) low temperature and high pressure
(4) high temperature and high pressure
6. Under which conditions of temperature and pressure would a real gas behave most like an ideal gas?
(1) $200 . \mathrm{K}$ and 50.0 kPa
(3) $600 . \mathrm{K}$ and 50.0 kPa
(2) 200. K and 200.0 kPa
(4) 600 . K and 200.0 kPa

## LESSON 2: GAS LAWS

## Objective:

- Determine the relationship between pressure, temperature and volume
- Compare different gases in reference to Avogadro's hypothesis

Avogadro's Hypothesis states that $\qquad$ volumes of different gases as the $\qquad$ temperature and pressure contain $\qquad$ .

1. Balloon A contains carbon dioxide gas. An identical Balloon B contains Neon gas. The diagram below represents these balloons and the conditions of pressure, volume, and temperature of the gas in each balloon.

Balloon A

Carbon dioxide gas
$P=150 . \mathrm{kPa}$
$\mathrm{V}=4.25 \mathrm{~L}$
$\mathrm{T}=298 \mathrm{~K}$

Balloon B

Compare the total number of gas particles in balloon A to the total number of gas particles in balloon B.
HINT: In writing your response to question 1, write a complete sentence and use the phrase "greater than", "less than" or "equal to".
2. The table below shows data for the temperature, pressure, and volume of four gas samples.

| Gas <br> Sample | Temperature <br> $(\mathrm{K})$ | Pressure <br> $(\mathrm{atm})$ | Volume <br> $(\mathrm{mL})$ |
| :---: | :---: | :---: | :---: |
| A | 100. | 2 | 400. |
| B | 200. | 2 | 200. |
| C | 100. | 2 | 400. |
| D | 200. | 4 | 200. |

Which two gas samples have the same total number of molecules?

## Boyle's Law relates pressure and volume. When pressure is increased on a gas at constant temperature, the volume <br> $\qquad$ . This is $a(n)$ <br> $\qquad$ relationship.

## FILL IN THE BLANKS WITH INCREASE(S) OR DECREASE(S).

3. Pilots suffer from intestinal pain when they fly because at higher altitudes, the pressure is decreased so the air volume in their body $\qquad$ .
4. Your lungs suck in air when the diaphragm is enlarged. When the diaphragm opens, the lung expands, the volume $\qquad$ and the pressure $\qquad$ which allows air in. When the diaphragm collapsed, there is less room so the volume $\qquad$ and the pressure $\qquad$ .
5. Scuba divers need to be careful when checking their air tanks. When they descend in the water the water pressure increases and pushes on the tank. The tank air pressure increases and the volume of the air $\qquad$ . When they ascend to the surface, the pressure decreases and the volume of the gas in their tank and body $\qquad$ _.
6. Why do you ears pop on an airplane? (Hint: the air pressure decreases at high altitudes.) explain in terms of pressure and volume.

## Charles' Law relates volume and temperature. When temperature is increased on a gas at constant pressure, the volume <br> $\qquad$ . This is a(n) relationship.

 FILL IN THE BLANKS WITH INCREASE(S) OR DECREASE(S).7. Hot air balloons work based on density changes affected by Charles law. To rise, the temperature is $\qquad$ and the volume $\qquad$ to make the density low. To come back down the fire is turned off so the temperature $\qquad$ and volume $\qquad$ so the density increases. The balloon is always inflated so the pressure is relatively constant.
8. To un-dent ping pong balls submerge them in hot water. Explain this phenomenon in terms of volume and temperature.
9. A balloon outside in the winter seems to deflate but inside it re-inflates. However the number of gas molecules stays constant. How does that happen? Explain in terms of volume and temperature.

Gay Lussac's Law relates pressure and temperature. When temperature is increased on a gas at constant volume (in a rigid container), the pressure $\qquad$ because the gas molecules move more. This is a(n) $\qquad$ relationship.

FILL IN THE BLANKS WITH INCREASE(S) OR DECREASE(S).
10. Drivers need to check the air pressure on their tires during change of seasons. In the winter the temperatures are decreased, the pressure inside the tires is $\qquad$ and the tires are flat. In the summer temperatures are increased and pressures are $\qquad$ so the tires are swollen. But the volume the tires air can occupy stays the same.
11. Don't put aerosol spray cans in direct heat or flames because they explode. Explain this phenomenon in terms of pressure and temperature.
12. Which sample at STP has the same number of molecules as 5 liters of $\mathrm{NO}_{2}(\mathrm{~g})$ at STP?
(1) 5 grams of $\mathrm{H}_{2}(\mathrm{~g})$
(3) 5 moles of $\mathrm{O}_{2}(\mathrm{~g})$
(2) 5 liters of $\mathrm{CH}_{4}(\mathrm{~g})$
(4) $5 \times 10^{23}$ molecules of $\mathrm{CO}_{2}(\mathrm{~g})$
13. At the same temperature and pressure, 1.0 liter of $\mathrm{CO}(\mathrm{g})$ and 1.0 liter of $\mathrm{CO}_{2}(\mathrm{~g})$ have
(1) Equal volumes and the same number of molecules
(2) Equal masses and the same number of molecules
(3) Different masses and a different number of molecules
(4) Different volumes and a different number of molecules
14. At the same temperature and pressure, which sample contains the same number of moles of particles as 1 liter of $\mathrm{O}_{2}(\mathrm{~g})$ ?
(1) $1 \mathrm{LNe}(\mathrm{g})$
(2) $0.5 \mathrm{~L} \mathrm{SO}_{2}(g)$
(3) $2 \mathrm{LO}_{2}(\mathrm{~g})$
(4) 1 L of $\mathrm{H}_{2} \mathrm{O}$ (I)

## LESSON 3: COMBINED GAS LAW

## Objective:

- Solve gas law problems using the combined gas law equation
- Convert from Celsius temperatures to Kelvin
- Convert between pressure units (atm and kPa)

Copy the combined gas low formula here:
$\square$

## Remember temperature must be in Kelvin.

1. If the temperature of a 50 mL sample of a gas is changed from 200 K to 400 K under constant pressure, what is the new volume of the gas?
$\mathrm{P}_{1}=\quad \mathrm{P}_{2}=$
$\mathrm{V}_{1}=\quad \mathrm{V}_{2}=$
$\mathrm{T}_{1}=\quad \mathrm{T}_{2}=$
2. The volume of a gas is 204 mL when the pressure is 925 kPa . At constant temperature, what is the final pressure if the volume increases to 306 ml ?

| $\mathrm{P}_{1}=$ | $\mathrm{P}_{2}=$ |
| :--- | :--- |
| $\mathrm{V}_{1}=$ | $\mathrm{V}_{2}=$ |
| $\mathrm{T}_{1}=$ | $\mathrm{T}_{2}=$ |

3. A balloon has a volume of 1.75 L at a temperature of 298 K . What will be the volume of the balloon if you take it out into the winter cold air at 258 K ? Assume pressure is constant.
$\mathrm{P}_{1}=$
$\mathrm{P}_{2}=$
$\mathrm{V}_{1}=\quad \mathrm{V}_{2}=$
$\mathrm{T}_{1}=\quad \mathrm{T}_{2}=$
4. An aerosol spray can with a volume of 456 mL contains 3.18 g of propane gas as a propellant. If the can is at $23^{\circ} \mathrm{C}$, and 50 . atm, what volume would the propane occupy at STP?

| $\mathrm{P}_{1}=$ | $\mathrm{P}_{2}=$ |
| :--- | :--- |
| $\mathrm{V}_{1}=$ | $\mathrm{V}_{2}=$ |
| $\mathrm{T}_{1}=$ | $\mathrm{T}_{2}=$ |

5. Divers get "the bends" if they come up too fast because gas in their blood expands, forming bubbles in their blood. If a diver has 5.0 mL of gas in his blood under a pressure of 250 atm, then rises instantaneously to a depth where his blood has a pressure of 50.0 atm , what will the volume of gas in his blood be?

| $\mathrm{P}_{1}=$ | $\mathrm{P}_{2}=$ |
| :--- | :--- |
| $\mathrm{V}_{1}=$ | $\mathrm{V}_{2}=$ |
| $\mathrm{T}_{1}=$ | $\mathrm{T}_{2}=$ |

6. A gas has a volume of 2.00 L at 323 K and 3.00 atm . What will be the new volume if the temperature is changed to 273 K and the pressure is changed to 1 atm?
$\mathrm{P}_{1}=\quad \mathrm{P}_{2}=$
$\mathrm{V}_{1}=\quad \mathrm{V}_{2}=$
$\mathrm{T}_{1}=\quad \mathrm{T}_{2}=$
7. A gas at STP has a volume of 1.00 L . If the pressure is doubled and the temperature remains constant, what is the new volume of the gas?
$\mathrm{P}_{1}=\quad \mathrm{P}_{2}=$
$\mathrm{V}_{1}=\quad \mathrm{V}_{2}=$
$\mathrm{T}_{1}=\quad \mathrm{T}_{2}=$
8. A 2.5 L sample of gas is at STP. When the temperature is raised to $373^{\circ} \mathrm{C}$ and the pressure remains constant what will the new volume of the gas be?
$\begin{array}{ll}\mathrm{P}_{1}= & \mathrm{P}_{2}= \\ \mathrm{V}_{1}= & \mathrm{V}_{2}= \\ \mathrm{T}_{1}= & \mathrm{T}_{2}=\end{array}$
9. A sample of gas is held at constant pressure. Increasing the kelvin temperature of this gas sample causes the average kinetic energy of its molecules to
a. decrease and the volume of the gas sample to decrease
b. decrease and the volume of the gas sample to increase
c. increase and the volume of the gas sample to decrease
d. increase and the volume of the gas sample to increase
10. Air bags are an important safety feature in modern automobiles. An air bag is inflated in milliseconds by the explosive decomposition of $\mathrm{NaN}_{3}(\mathrm{~s})$. The decomposition reaction produces $\mathrm{N}_{2}(\mathrm{~g})$, as well as $\mathrm{Na}(\mathrm{s})$, according to the unbalanced equation below.
$\ldots \mathrm{NaN}_{3}(\mathrm{~s}) \rightarrow$ __ $\mathrm{Na}(\mathrm{s})+\ldots \mathrm{N}_{2}(\mathrm{~g})$
a.) Balance the above equation using the smallest whole-number coefficients.
b.) When the air bag inflates, the nitrogen gas is at a pressure of 1.30 atmospheres, a temperature of 301 K , and has a volume of 40.0 liters. Calculate the volume of the nitrogen gas at STP.
$P_{1}=\quad P_{2}=$
$\mathrm{V}_{1}=\quad \mathrm{V}_{2}=$
$\mathrm{T}_{1}=\quad \mathrm{T}_{2}=$

## Review Questions:

1. A rigid cylinder is fitted with a movable piston. The cylinder contains a sample of helium gas, $\mathrm{He}(\mathrm{g})$, which has an initial volume of 125.0 milliliters and an initial pressure of 1.0 atmosphere, as shown below. The temperature of the helium gas sample is $20.0^{\circ} \mathrm{C}$.

a.) Express the initial volume of the helium gas sample, in liters.
b.) The piston is pushed further into the cylinder. Show a correct numerical setup for calculating the volume of the helium gas that is anticipated when the reading on the pressure gauge is 1.5 atmospheres. The temperature of the helium gas remains constant.
c.) Helium gas is removed from the cylinder and a sample of nitrogen gas, $\mathrm{N}_{2}(\mathrm{~g})$, is added to the cylinder. The nitrogen gas has a volume of 125.0 milliliters and a pressure of 1.0 atmosphere at $20.0^{\circ} \mathrm{C}$. Compare the number of particles in this nitrogen gas sample to the number of particles in the original helium gas sample.

## LESSON 4: VAPOR PRESSURE

## Objective:

- Differentiate between evaporation and boiling
- Determine effects of vapor pressure on boiling point

DEMO:

What happens to the water when the pressure inside the chamber decreases? $\qquad$
What is the relationship between atmospheric pressure and boiling pt? $\qquad$

Based upon the demo, why does it take longer to cook food such as pasta at extremely high altitudes?
$\qquad$
$\qquad$ .

1. Liquids evaporate when they are left in the open air. This is also known as $\qquad$ . Liquids also go through this phase change in closed containers. The vapor that is produced in either container exerts a pressure on top of the liquid phase. This pressure is known as $\qquad$
$\qquad$ .
2. In order for the vapor to escape its original liquid phase completely its pressure must overcome the regular atmospheric pressure above it. As temperature of the liquid increases, the number of particles evaporating $\qquad$ and the vapor pressure $\qquad$ . Therefore, temperature and vapor pressure have a direct correlation.
3. Under high atmospheric pressure, the liquid will have a harder time escaping the liquid phase so the temperature at which it boils is higher than normal. Under low atmospheric pressure, the liquid will have an easier time escaping the liquid phase so the temperature at which it boils is $\qquad$ than normal.

## Use Table H to answer these questions:

1. Which substance has the lowest boiling point?
2. Which substance has a normal boiling point of $100 .{ }^{\circ} \mathrm{C}$ ?
$\qquad$
3. What is the normal boiling point of propanone? $\qquad$
4. Which substance has the highest vapor pressure at $40 .{ }^{\circ} \mathrm{C}$ ?
5. At what pressure will water boil at $90 .{ }^{\circ} \mathrm{C}$ ?

6. At what pressure will propanone boil at $20 .{ }^{\circ} \mathrm{C}$ ?
7. What temperature will ethanoic acid boil at 48 kPa ?
8. What temperature will water boil at $110 . \mathrm{kPa}$ ?
$\qquad$
$\qquad$
$\qquad$

9. The stronger the intermolecular forces of attraction (particle attractions or IMF's) the $\qquad$ (more or less?) energy required to break them.
10. The stronger the IMF's, the $\qquad$ (higher or lower?) the vapor pressure at any given temperature. Explanation: $\qquad$
$\qquad$

The weaker the IMF's, the $\qquad$ (harder or easier?) it is for a liquid to evaporate. Explanation: $\qquad$
3. If water is boiling at $70 .{ }^{\circ} \mathrm{C}$, what is the vapor pressure? $\qquad$ kPa
4. What is the vapor pressure of ethanol at $90 .{ }^{\circ} \mathrm{C}$ ? $\qquad$ atm
5. What is meant by "normal" boiling point?
6. What is the normal boiling point of ethanoic acid? $\qquad$ ${ }^{\circ} \mathrm{C}$
7. Which of the 4 substances evaporates most rapidly at $50 .{ }^{\circ} \mathrm{C}$ ?
8. Which substance has the weakest IMF's between its molecules? $\qquad$
